

APTURA TECH SOLUTIONS

1-Month Internship Program – Batch 02

Week 02 Task

Healthcare Appointment Booking Application

UX Case Study & Documentation

Prepared By

Gittiqa Kumari
UI/UX Design Internship

UI/UX Design

Objective

Design intuitive, accessible, and usercentered digital experiences using professional UX methodologies. **Task 01: Healthcare Mobile Application**

Design a complete UI/UX prototype for a **Healthcare Appointment Booking Application**.

The design should include:

- . User Research
- . User Personas
- . User Journey Map
- . Information Architecture
- . Wireframes
- . High-Fidelity UI
- . Interactive Prototype
- . Design System
- . Accessibility Considerations

Project Overview

The Healthcare Appointment Booking Application was designed to make the appointment booking process simple, fast, and user-friendly. Users can easily search for doctors, view their profiles, choose an available date and time, and confirm their appointment without any confusion. The main goal of this project was to create a clean and accessible experience that can be used by people of different age groups and technical skill levels

Objective

The objective of this project was to design a modern healthcare mobile application that makes booking a doctor's appointment easier and more convenient. The design process focused on improving usability, accessibility, and consistency while following a complete UX workflow from research to high-fidelity prototyping

Design Process

The application was designed by following these UX design stages:

- User Research
- User Persona
- User Journey Map
- Information Architecture
- Low-Fidelity Wireframes
- High-Fidelity UI Design
- Interactive Prototype
- Design System
- Accessibility Consideration

User Research

To understand users' needs, basic research was conducted. The following requirements were identified:

- Users prefer a quick and simple appointment booking process.
- Doctor availability should be easy to view before booking.
- Appointment reminders help users avoid missing appointments.
- Searching doctors by specialization makes the process faster.
- Ratings and reviews help users choose trusted doctors.

USER RESEARCH

USER RESEARCH

1. Users want quick and easy appointment booking.

2. Doctor availability and fees should be clearly visible.

3. Reminders and Notifications help users remember appointments.

4. Elderly users prefer larger text and simple navigation.

5. Users compare doctors based on reviews and experience.

User Persona

Name

Ansha Khan

Age

32 Years

Occupation

School Teacher

Location

Karachi, Pakistan

Goals

- Book appointments quickly
- Find trusted doctors
- Save time

Pain Points

- Long waiting times
- Complicated booking process
- Difficulty finding available appointment slots

USER PERSONA

User Journey

The user journey follows these simple steps:

1. Open the application
2. Search for a doctor

3. View the doctor's profile
4. Book an appointment
5. Select the preferred date and time
6. Confirm the appointment
7. Receive a booking confirmation

Information Architecture

The application structure is organized as follows:

Low-Fidelity Wireframes

Low-fidelity wireframes were created to plan the overall layout and user flow before designing the final interface. They helped organize the screen structure, navigation, and content placement, making it easier to improve the design before moving to the high-fidelity stage.

Low Fidelity Wireframes

UX PROCESS

USER RESEARCH

USER RESEARCH

1. User want quick and easy appointment booking.
2. Doctor availability and fees should be clearly visible.
3. Reminders and Notifications help users remember appointments.
4. Elderly users prefer larger text and simple navigation.
5. Users compares doctors based on reviews and experience.

USER PERSONA

USER PERSONA

Ansha Khan
Age: 32
Occupation: School Teacher
Location: (Karachi), Pakistan

Goals

- Book appointment quickly
- Find trusted doctors

Pain Points

- Long waiting time on calls
- Confusing booking process
- Hard to find available slots

Low Fidelity Wireframes

High-Fidelity UI

The final design includes the following screens:

- Splash Screen
- Login Screen
- Home Screen
- Doctor Details
- Book Appointment
- Select Date & Time
- Confirmation Screen
- Booking Success Screen

The interface uses a modern healthcare theme with consistent colors, clean typography, and reusable UI components to provide a simple and pleasant user experience.

Design System

The Design System includes:

- Logo
- Color Palette
- Typography
- Spacing Scale
- Buttons
- Input Fields
- Doctor Card
- Calendar
- Time Slots
- Bottom Navigation

Using reusable components helped maintain consistency throughout the application and made the design process more organized.

Accessibility Considerations

The design was created with accessibility in mind by including:

- High color contrast for better readability
- Large touch targets for easier interaction
- Clear and readable typography
- Consistent navigation across all screens
- Simple labels and icons
- A clean visual hierarchy
- An easy and straightforward booking process

These improvements make the application more comfortable to use for people of different ages and experience levels.

Question 01

Conduct a usability evaluation of your design by identifying **at least five usability challenges**. Propose improvements based on established usability principles (e.g., Nielsen's Heuristics or other recognized UX guidelines).

During the design process, I reviewed my application using Nielsen's usability principles and identified a few areas that could be improved.

1. Small Touch Targets

At first, some buttons and interactive elements were smaller than expected, which could make tapping difficult for users. To improve usability, I increased the button sizes and made sure they were easier to tap on mobile devices.

2. Low Text Contrast

Some text did not stand out clearly against the background. I improved the color contrast so that users can read the content more comfortably in different lighting conditions.

3. Complex Booking Process

The original booking flow had a few unnecessary steps that could slow users down. I simplified the process by organizing the screens in a more logical order, making it quicker and easier to book an appointment.

4. Limited System Feedback

Initially, users did not receive enough feedback after completing an action. I added confirmation messages and a success screen so users always know when their appointment has been booked successfully.

5. Difficulty Checking Doctor Availability

It was not very easy to understand which doctors were available. To solve this, I displayed doctor availability, ratings, and consultation details more clearly, helping users make better decisions before booking.

Question 02

Explain how your design accommodates users of different age groups, technical skill levels, and accessibility needs while maintaining consistency and visual hierarchy.

While designing the application, I wanted to make sure it would be easy to use for people of different ages, technical backgrounds, and accessibility needs.

- The interface uses a clean and simple layout so users can quickly understand where to go next.
- Clear icons and labels help first-time users navigate the application without confusion.
- Consistent colors, typography, and reusable components create a familiar and visually balanced experience across all screens.
- Large buttons and touch-friendly controls make the application easier to use on mobile devices.
- A clear visual hierarchy guides users step by step, making important actions easy to find.

The appointment booking process was kept simple to reduce user effort and help users complete their tasks quickly and confidently.
