Project 1 By Aptura Tech Solutions:

Mobile Banking Application UI/UX Design Report

Objective

Design a modern, user-friendly mobile banking application following UI/UX principles with user flow, wireframes, high-fidelity screens, prototype, and design system.

User Persona

Target user: Busy working professional who wants fast, secure, and simple banking. Main goals include checking balance, transferring money, paying bills, and viewing transactions. Pain points include complex banking apps, confusing interfaces, and slow access to information.

User Flow

Splash → Login → OTP Verification → Dashboard → Transfer Money → Confirm Transfer → Transaction Successful.

Low-Fidelity Wireframes

Created basic wireframes to define layout, navigation, and screen hierarchy before visual design.

High-Fidelity Design

Designed seven screens: Splash, Login, OTP Verification, Dashboard, Transfer Money, Confirm Transfer, and Transaction Successful using a consistent design system.

Design System

Primary Color: #2F6BFF, Background: #F5F7FA, Font: Poppins, 8-point spacing system, reusable components including buttons, input fields, balance card, transaction card, navigation bar, and top app bar.

Prototype:

Question 1: Heuristic Evaluation

After reviewing my mobile banking application design, I identified a few usability issues and improved them to create a better user experience.

1. Small Touch Targets

Some buttons were too small and could be difficult to tap. I increased their size to make them easier and more comfortable to use.

2. Low Text Contrast

A few text elements were not clearly visible. I improved the color contrast so that the content is easier to read for all users.

3. Lengthy Money Transfer Process

The transfer process originally felt longer than necessary. I simplified the flow by reducing extra steps, making the transaction quicker and easier.

4. Lack of User Feedback

Users need confirmation after completing important actions. I added confirmation and success screens so users always know whether their transaction was completed successfully.

5. Balance Privacy

Displaying the account balance all the time may reduce user privacy. I added a **Show/Hide Balance** option so users can hide their balance whenever needed.

Question 2: Design Decisions

While designing the application, my main focus was to make the banking experience simple, modern, and easy to use.

I used a clean layout with proper spacing, clear typography, and a consistent color palette to make the interface easy to understand. Large buttons and well-organized sections help users navigate the app without confusion.

To improve accessibility, I used readable fonts, good color contrast, and touch-friendly button sizes. These choices make the application more comfortable for users of different ages and abilities.

To improve user engagement and conversion, I reduced unnecessary steps in the money transfer process and used clear call-to-action buttons. Confirmation and success screens also give users confidence that their transactions have been completed successfully.

Overall, these design decisions provide a smoother and more user-friendly experience compared to many traditional banking applications.

Thanks
